SYARIAH DIGITAL CHECK

UI/UX Design Guide & Interactive Prototype Structure

Cerdas Sebelum Transaksi, Bijak dalam Pilihan

Prepared as a visual design reference for Firza Miftahul Ilmi's SYLS 2026 campaign. The concept board is a visual direction, not evidence that a native Android/iOS app has already been built or tested.

1. Product direction

Syariah Digital Check helps young people pause and understand digital financial transactions before deciding. The experience is organized around **PAUSE** → **CHECK** → **CHOOSE** and prioritizes practical education over automated religious or financial judgments.

Design principles

Principle	Implementation
Premium fintech	Emerald green, ivory, restrained gold, clean cards, generous spacing, consistent typography.
Mobile-first	One-handed interactions, clear touch targets, safe-area awareness, readable text.
Educational, not authoritative	Explain what to verify; never certify a transaction as halal/haram or safe.
Trust and transparency	Show sources and review dates for educational claims; disclose uncertainty.
Privacy-first	No bank credentials or unnecessary personal data; store learning progress locally for the MVP.

Visual tokens

Token	Value / guidance
Primary	#065F46 (deep emerald)
Secondary	#047857 (emerald)
Background	#F8F7F0 (warm ivory)
Surface	#FFFFFF
Accent	#C7A76C (restrained gold)
Text	#102A24 / slate for secondary copy
Corners	16–24 px for cards; 12–16 px for controls
Motion	Short, subtle transitions; respect reduced-motion preferences

2. Screen inventory and purpose

01 Splash — Brand mark, product name, tagline, short transition.

02 Onboarding — Three slides: PAUSE, CHECK, CHOOSE; skip/next/get started; persist completion.

03 Home dashboard — Start checklist, daily lesson, featured scenario, learning progress.

04 Transaction selection — Choose a scenario/category such as shopping, PayLater, gold, savings, subscriptions, or donations.

05 Checklist (5 steps) — Akad/structure, transparency, mechanism, Sharia aspects to verify, decision readiness.

06 Checklist result — Summarize answers, identify unknowns, suggest questions and sources; no halal/haram certification.

07 Scenario detail — Fictional case, answer choices, explanations, next steps, source/lesson link.

08 Learning hub — Searchable bite-sized articles, categories, reading time, references, review dates.

09 Quiz — Multiple choice, instant feedback, score, explanation, retry.

10 Progress dashboard — Actual local totals, lesson completion, quiz attempts/scores, pre/post assessment if implemented.

11 Profile & settings — Optional display name, language, privacy, disclaimer, reset progress, sources.

12 UI component library — Primary/secondary buttons, fields, cards, chips, progress bars, icons, status labels.

3. Primary user flow

Splash → Onboarding → Home → Select transaction type → Checklist steps 1–5 → Educational result → Suggested lesson/source → Save progress → Home / Learning Hub / Quiz.

Navigation recommendation

Use a bottom tab bar for Home, Check, Learn, Quiz, and Profile. The checklist flow should use a focused full-screen layout with a visible step count and Back/Continue actions. Results should provide a clear route to relevant learning content and a new check.

4. Checklist logic and content rules

Step	Question	What the app should do
1. Akad / structure	What is actually happening in this transaction?	Help users identify the contract/product structure; do not guess if unclear.
2. Transparency	Are price, fees, terms and consequences clear?	Allow Clear / Unclear / Not checked.
3. Mechanism	How does the transaction work from start to finish?	Prompt review of payment, installments, fees, cancellation and obligations where relevant.
4. Sharia aspects	What Sharia considerations should I understand or verify?	Point to reliable guidance; never auto-issue a fatwa.
5. Readiness	Do I understand enough to decide?	Allow Understand / Need to check / Do not understand.

Result states

Information understood: encourage reviewing the actual provider terms before deciding. **Needs checking:** list missing details and suggested questions. **Not understood yet:** encourage pausing and asking the provider or a competent source for clarification.

Mandatory disclaimer

Aplikasi ini merupakan sarana edukasi literasi keuangan syariah, bukan fatwa, nasihat keuangan profesional, atau sertifikasi kepatuhan syariah. Informasi transaksi dapat berbeda berdasarkan akad, ketentuan produk, dan kondisi yang berlaku. Periksa dokumen resmi dan konsultasikan pertanyaan syariah kepada pihak yang kompeten.

5. Prototype and implementation handoff

Suggested production stack

React Native + Expo + TypeScript, Expo Router, AsyncStorage for local progress, bundled educational content for offline use, and Jest/React Native Testing Library for core logic. A backend is not required for the first demonstrable MVP.

Suggested folder structure

```
src/
  app/ or app/                  # Expo Router routes
  components/                   # Buttons, cards, fields, progress indicators
  features/

```

Minimum acceptance checks

• Onboarding completion survives app restart.

• Checklist supports back navigation, answer edits, validation, and locally saved sessions.

• Result state matches the user's answers and never claims to certify Sharia status.

• Scenario answers and quiz scoring have automated tests.

• Learning progress persists and reset requires confirmation.

• Core content works offline; source metadata is visible.

• Android/iOS run instructions are documented; only verified builds are claimed.

Note: this document is a design and engineering handoff. The included visual board is illustrative. It is not a native-app build report.
